Prolactin may influence testosterone and androgen synthesis

Mecanism of action

1 Prolactin impairs production of GnRH in the hypothalamus leading to suppressed LH and FSH and low testosterone and spermatogenesis

2 Direct inhibitory action on the testis

Hyperprolactinemia is a rare cause of ED. It is generally secondary to a **pituitary adenoma**. In this case, ED is accompanied by **decreased sexual interest, and spermatogenesis**. **Gynecomastia** is often present.
